

EndoAware

Early Risk Detection
for Endometriosis

When pain becomes normal, disease becomes invisible.

The Core Problem?

There is no accessible early-warning system for endometriosis risk.

Problem Focus: Endometriosis

Endometriosis is a chronic inflammatory disorder where tissue similar to the uterine lining grows outside the uterus, affecting the ovaries, fallopian tubes, and pelvic lining.

Why It's Debilitating

- Severe menstrual pain
- Chronic pelvic pain
- Pain during intercourse
- Infertility
- Fatigue & distress

01 Affects **~1 in 10** women of reproductive age

02 Average diagnostic delay: **6–10 years**

03 Present in **30–50%** of women with infertility

Lack of Awareness

Endometriosis affects millions of women worldwide, yet awareness remains critically low. Severe menstrual pain is often normalized, and many young women are never educated about symptoms that may signal an underlying condition.

Studies indicate that patients frequently consult multiple doctors before receiving an accurate diagnosis.

As a result, pain is dismissed, conversations are avoided, and diagnosis is delayed for years.

A common condition — yet widely misunderstood.

The Gap in Current Healthcare & Digital Tools

Healthcare Gap

- Severe menstrual pain is often normalized
- Confirmation requires invasive procedures
- No structured early-risk screening at primary level

Digital Gap

Most period-tracking apps:

- Track cycles and ovulation
- Predict PMS

But they do not:

- Analyze chronic pain patterns
- Detect multi-cycle symptom trends
- Prompt early medical consultation

Our Solution: EndoAware

EndoAware is a symptom-based digital awareness platform designed to identify early risk patterns of endometriosis through menstrual and pain tracking.

By analyzing recurring symptom trends across cycles, the app provides a structured risk indication and encourages timely medical consultation.

Turning normalized pain into actionable awareness.

How EndoAware Works

01.

Data Input Layer

User-Logged Parameters:

- Menstrual cycle dates
- Pain intensity (VAS scale 1–10)
- Duration & recurrence of pain
- Associated symptoms
 - Pelvic pain
 - GI discomfort
 - Dyspareunia
 - Fatigue
- Family history (if any)

Continuous logging across multiple cycles builds the dataset.

02.

Pattern Analysis Engine

Symptom-Based Risk Modeling:

- Multi-cycle trend tracking
- Pain severity persistence detection
- Symptom clustering analysis
- Weighted red-flag scoring system

The engine identifies:

- Chronicity
- Escalation patterns
- Cross-symptom correlations

03.

Risk-Based Output Layer

Structured Awareness Response:

- Risk categorization
 - Low
 - Moderate
 - High
- Context-based insights
- Consultation prompt (if needed)
- Downloadable health summary report

Encourages early medical evaluation without replacing diagnosis.

Why This Matters

Endometriosis is frequently diagnosed years after symptoms begin because severe menstrual pain is often dismissed as normal. By enabling early risk awareness through structured symptom tracking, EndoAware encourages timely medical consultation before the disease progresses.

Early intervention can improve quality of life, protect reproductive health, and empower women to make informed healthcare decisions.

01

**Women aged
13–40 years**

02

**Adolescents with
severe menstrual
pain**

03

**Schools & colleges
outreach**

04

**Multilingual rural
accessibility**

05

**NGO & hospital
partnerships**

06

**Public health &
research
collaborations**

**Market
&
Scalability**

Future Scope & Expansion

01

AI-Based Predictive Modeling

Personalized risk assessment using multi-cycle symptom analytics.

02

Wearable & Health Data Integration:

Integration of physiological health metrics to strengthen symptom correlation and pattern detection.

03

Structured Tele-Consultation Access:

Secure in-app consultation with verified gynecologists supported by standardized symptom reports.

04

Awareness & Early-Screening Outreach:

Educational resources and validated self-screening tools to promote early recognition and timely medical evaluation.

Conclusion: A Step Toward Early Awareness

Endometriosis often remains undetected for years, not because symptoms are absent, but because they are normalized.

EndoAware transforms symptom tracking into structured risk awareness, encouraging timely medical consultation and informed decision-making.

Early awareness can change the trajectory of a chronic disease.

A large, light pink cloud-like shape with a scalloped border, centered on a white background. Inside the cloud, the text "Thank you very much!" is written in a bold, dark red font with a white outline.

**Thank
you very
much!**
